Features

• Topic Page - New
• Presentation Maker
• Procedures Consult
The main source of evidence has been from the Cochrane Collaboration. Evidence is summarized from systematic reviews of primary research.

1. First Consult – EBM Database
2. Conn’s Current Therapy 2014
3. Ferri’s Clinical Advisor 2015
4. Goldman’s Cecil Medicine
1. 輸入關鍵字查詢

- Urinary Tract Infection
- Recurrent urinary tract infection
- Medical evaluation, utilization review

Presentation Maker 製作圖片簡報 (多選圖片儲存並輸出)

A 58-year-old man in coma after cardiogenic shock associated with a severe mechanical aortic valve dysfunction, endocarditis, aortic root abscess, and an aorta-to-right-atrium fistula (case 14). After surgery for a modified Bentall procedure, he continued in cardiogenic and septic shock. Head CT scan revealed a small subcortical area of infarct in the left precentral gyrus and posterior inferior left temporal lobe. Electroencephalogram showed diffuse, nonspecific slowing of cerebral activity (delta frequency range), with minimal response to painful stimulation and no epileptiform features. Neurologic diagnosis indicated global encephalopathy due to metabolic and hypoxic brain injury. Auditory-evoked potentials were recorded 3 days after coma onset and 12 hours after sedation. Panels A and B The ERPs showed a small distinguishable N100 in the standard response, but it became nonreproducible in the deviant response. Panel C The subtracted waveform did not show MMN. Panel D The middle latency AEPs showed a wave V (broadform) and a low-amplitude Pa wave. In the subsequent 12 days, the patient became unresponsive, and it was clear that there were no remaining neurologic activities. In the light of the patient's previously stated advance care directives, it was the patient's family decision to withdraw care.

Auditory-evoked potentials during coma: Do they improve our prediction of awakening in comatose patients?

Procedures Consult 臨床技能 & 手術教學 涵蓋 6 大科

- Anesthesiology
- Emergency Medicine
- Family Medicine
- Internal Medicine
- Orthopaedics
- Pediatrics
- Surgery
1. 下拉式選單選擇Procedures Consult
Central Venous Catheterization: Internal Jugular Approach

CLINICAL PEARLS

If a return of blood is not obtained within 3-5 cm, stop advancement and slowly withdraw the needle while pulling back on the plunger.

Occasionally the needle will have transfixed the vein, but will fill when the needle is withdrawn.
